

**General Instructions:**

Locate battery on CG and attach Power Block nearby. Route Servo Cables to components, securely fasten modules to the plane. Left and Right wingtip modules are self explanatory, mount headlight modules on the leading edge of the wings, the flashing module on the underside of the tail section and the yellow tail modules on either the vertical stabilizer or under the elevator area.

The system is designed so you can see both wingtips 95% of the time while in flight avoiding a loss of orientation.

As always, fly safe and have fun.
