

General Instructions:

Locate battery on CG and attach power "Y" connector nearby. Route Servo Cables to connectors, securely fasten strips to the plane, clean area with alchohol first. Left and Right wing strips are self explanatory, mount headlight strips on the leading edge of the wings, then wrap the Red and Green strips along the wing Top, Bottom and Side. The taillight yellow strips can be attached on either the vertical stabilizer or under the elevator area.

The system is designed so you can see both wingtips 95% of the time while in flight avoiding a loss of orientation.

As always, fly safe and have fun.
